1 - Customer Behavior Analysis

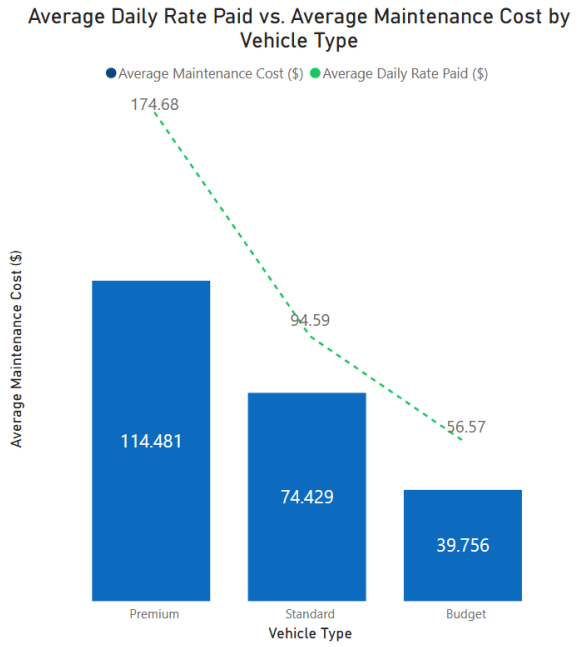

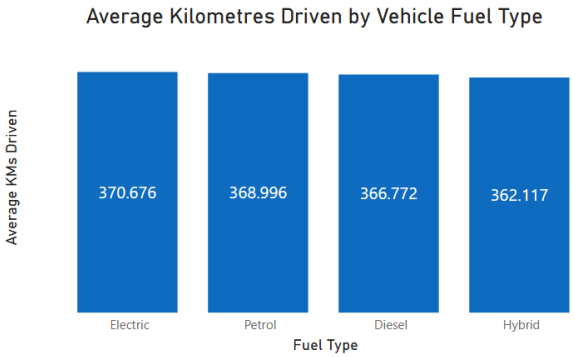

In the first graph, booking channels analysis show us there is correlation between booking channels and customer income groups. When we review the booking channels in detail for each income segment, we see that Mobile App and Website channels dominated with the highest score in High income segment. We also see that website users have the biggest score in medium income segment, and it also has a huge amount in high income segment. Overall, Mobile App and Website are the most important booking channels that directs your huge amount of customers.

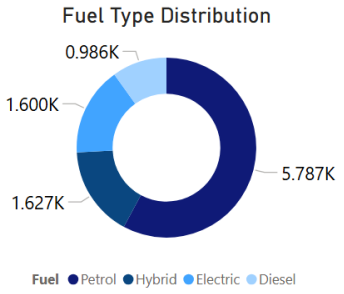

The graph of the low income groups show us, they are more tend to use traditional booking methods such as “Walk-in”. The website booking channel is the weakest one in the low income groups.

When we analyze the customer type and membership tier, we observe that the biggest majority of the revenue is coming from the “None” status membership. This data shows us, company needs to improve their membership programs to gain more loyal customer.

2- Fleet Management and Cost Analysis

In “Average Daily Rate Paid vs Avg Maintenance Cost by Vehicle Type” graph, line and stacked column chart have been used to see the balance of cost and income in detail in one graph. In the creation of this chart “Vehicle Type “ and “Average Maintance Cost” variable were used in X and Y axis in the coloumn chart and than “Average Daily Paid” variable have been inserted.

In horizontal axis, we reach the vehicle types such as Premium, Standard and Budget. Also, each boxes show us the how much the cost does the vehicle type have according to equality of vertical axis. And each line top of the boxes show us the Daily Rate in the graph.

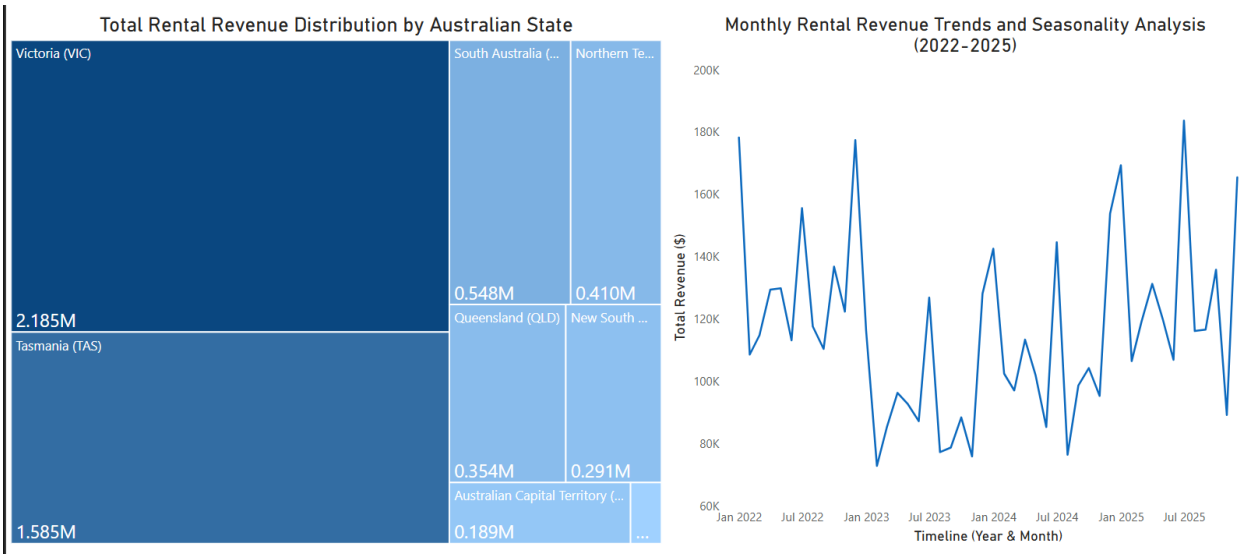

We see that Premium and Standard vehicle types generate the highest cash flow, but this cash flow also brings a highest maintenance cost at the same time. This shows, the company may need to optimize and develop the maintenance cost with their finance team.

When we examine the low Budget vehicle type, we clearly observe that this segment has the lowest Daily Paid Values compare to other segments. But also this segment has the lowest maintenance cost in total. This data bring us that even budget segment has the lowest value, it also provides an important amount of profit when we consider the every one dollar spent.

When we talk about the strategic decisions according to Cost & Income Analysis by Vehicle type, the first thing we can say, company should be careful about where to invest. In other say, the management team should not increase their operations by considering the huge number of daily paid in Premium and Standard. Because they may fall a business trap by thinking they make money based on the amount of revenue but in truth, the business may lose money because of profit rate.

“The Average Kilometers Driven By Fuel Type “graph is a column chart that show us how many kilometers have been made for each fuel type. And also, the donut chart of Fuel Type Distribution give us how many cars there are for each fuel type. Although we clearly observe that gasoline-powered vehicles are quite prevalent in the fuel distribution graph, when we look at the mileage graph, we see that the situation is different than expected. When we consider the mileage calculation (KMS) for each fuel type, we see that electric cars are the leader in this graph.However these values look very close to each other, it gives us an important insight that if the compant invest in electrical and hybrid cars, it will definitely decrease their future costs.

3 - Geographical & Seasonal Performance Analysis

To examine and interpret the company's financial performance in Australia on a state-by-state basis, we created a treemap chart using the state and total revenue variables. This graph allows us to see the total revenues in each state in a way that allows for comparison with proportional magnitudes.

When we would like to see the distribution of total revenue according to states in Australia, Top 3 states are orderly, Victoria, Tasmania and South Australia. Especially, Victoria and Tasmania are two important states that company definitely should keep the customer satisfied high to grow the business properly. However, the revenue in NSW looks low compared to VIC and TAS, company should develop new strategies to grow because Sydney has the biggest population and impact in Australia.

Finally, this graph shows us that we should avoid investing in the state of South Wales, where turnover is low and costs are equally high. Reducing investments in this region to a certain extent and redirecting resources to the higher-performing states of TAS and VIC would be much more beneficial for the company's future.

We prepared a line graph using total revenue and date data to analyze the company's sales on a monthly and seasonal basis. This graph allows us to see when sales peaked, when they declined, and which periods show similar trends in the cycle.

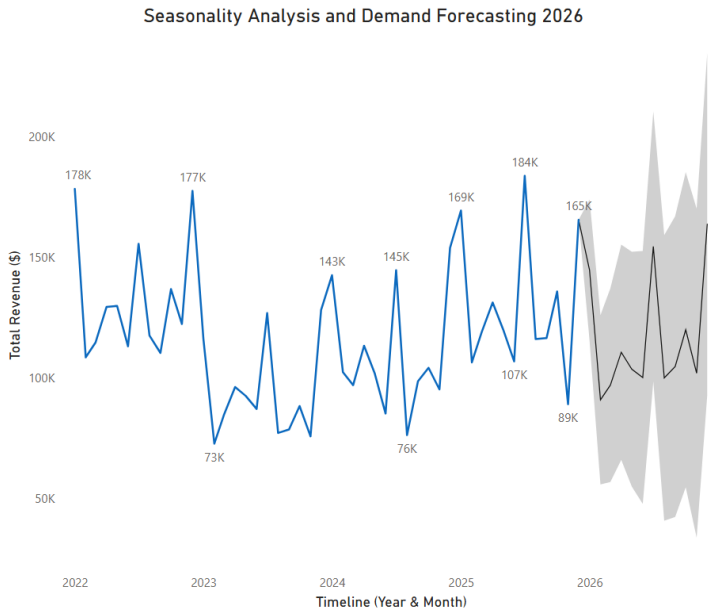

Another purpose of this graph design is to track the continuity of the company's growth and to make necessary improvements by examining the factors affecting growth according to historical data.

In monthly rental revenue trends and seasonality analysis, we observe that revenue is getting low in every Jul in every year. We assume that the reason is, this month Is a winter season in Australia. Also, we see that in December in every year, the revenue reaches the peak point thanks to the Christmas celebrations.

We observe that, apart from periods of sharp sales fluctuations, the market reaches a certain level of saturation and exhibits horizontal movements in between.

Our seasonal analyses provide us with clear information about three key decisions. Firstly, adopting a dynamic pricing strategy instead of a fixed price policy during peak sales periods like Christmas and New Year's will significantly increase company profitability by attracting more customers. Secondly, during periods of slow sales, it is necessary to increase leasing services to corporate clients to maintain cash flow. Finally, addressing maintenance cost improvements observed in our Fleet Management and Cost Analysis section during slow sales periods to ensure all vehicles are available during peak season will help increase revenue.

4 - Seasonality Analysis and Demand Forecasting For 2026

Year	Month	forecastValue	confidenceHighBound	confidenceLowBound
2026	April	110655	155204	66105
2026	August	100035	159169	40902
2026	December	163682	234455	92909
2026	February	90965	126017	55914
2026	January	144689	173854	115525
2026	July	154474	210320	98629
2026	June	100212	152564	47861
2026	March	97002	137085	56919
2026	May	103614	152221	55006
2026	November	101993	170043	33943
2026	October	119994	185207	54781
2026	September	104719	166967	42472

Time Series – ETS algorithm in Power BI is used to predict the total revenue in 2026. Also to understand the seasonal trend “seasonality” parameter was chosen in the Power Bi program. The black lines in the graph show the forecast data, while the gray areas above and below the lines show the variance values. We can use the table next to the graph to see this data in more detail.

According to calculation of ETS algorithm, the season will start with pretty high revenue which is approximately 140K thanks to the new year and holidays. But than it is expected that the revenue may decrease such as 90k - 97K on February and March. After that, we assume that the revenue will hit the low again (approximately 100k) in the beginning of the winter season between June and July. We also predict that in Christmas season, the revenue will increase and reach the peak point which is more than 150K as before.

5 -Usage of New Technologies To Improve The Business

In our analysis, we were able to visualize past data and make predictions about future sales data thanks to the PowerBI program. However, to ensure sustainable growth, we must make more use of digitalization technologies. For this purpose, one of the first technologies we will use in this regard is IoT. Especially thanks to developments in the field of artificial intelligence, we can examine vehicle maintenance costs earlier and develop solutions by placing AI-integrated sensors inside vehicles.

Another technology we can use in this area is AI agents. This technology, when integrated into websites and applications used by high and middle-income users, will significantly increase customer satisfaction in this area. Increasing customer satisfaction also means having more loyal customers.

In addition, when we build a system which is fully AI implemented, we will be able to make better Ai driven decisions. Because Ai will track the data dynamically and thanks to the LLM technologies we will take quick actions especially in the peak seasons.
